World Veterinary Day

**Our vets celebrates World Veterinary Day -
Dr. S. Ravivarman, Dr. R. Arunthathi, Dr. E. Vijay**

Farewell, Dr. Arunthathi

Dr. R. Arunthathi has been working as a full time veterinarian at Bark India for one year. Being a compassionate, hard working and dedicated veterinarian, she has made remarkable impact on the life of stray animals.

As she relieves from her duty at Bark India for higher studies, we wish her all the success and happiness for future. May your kindness and compassion help many more animals. Bark India family and our fur-kids will miss you.

Types of mange in dogs

Demodectic Mange

A parasitic skin infection caused by mites like *Demodex Canis*, *demodex injai* or *demodex cornei*.

Most cases of mange can be cured with on-time diagnosis and treatment. Not typically transmissible between dogs, and to humans.

Symptoms- localized patches of hair loss, red skin
Redness on entire body, infections, hair loss, crusts and swelling sometimes.

Since every dog reacts differently to medications, curing period also will be varied.

Sarcoptic Mange

Type of mange caused by mites that lies in the skin of healthy dogs as the skin is the feed on material. Its also known as scabies- zoonotic condition. Dogs with low immune system can be easily affected by it.

Symptoms include severe itching, hair loss, and self infected wounds on skin.

Transmissible from dog to dog and dog to human, proper medication needs to be given as per your veterinarian's advice.

The presence of sarcoptic mange can be identified with a skin scrapping.

Skin scrapping and hair folly examination can help the identification of the type of mange present in any dog. Mange is not visible to naked eyes. Please do not follow any medications without veterinary advice.
